While the Release Notes provide you with the most current information regarding SQLdm, the main Help gives you the detail you need to understand SQLdm and how it provides an unprecedented level of diagnostic information on the health, performance, and status of SQL Server instances across your environment.

You can use the main SQLdm Help to:

- Monitor SQL Server performance
- Alert on SQL Server metrics
- Report on SQL Server performance

You can use the SQLdm Wiki to:

- Learn about the Tech Preview of the new SQLdm Web Console.
Welcome to SQLdm

Want to know what's different about this release of SQLdm? See the following sections:

- New features in this release
- Issues fixed in this release
- Known issues
- Previously fixed issues
- Recommended Idera solutions

Want to access the main document for SQLdm? See Getting Started.

What is SQLdm?

SQL diagnostic manager (SQLdm) provides an unprecedented level of diagnostic information on the health, performance, and status of SQL Server instances across your environment. You can view, diagnose, and report on critical performance statistics from a central point of control.

Using a unique agentless architecture, SQLdm gathers diagnostic information in real time, keeping database administrators and managers informed by providing customized alerts. Easy to install and use, SQLdm is an indispensable SQL Server management tool that benefits both experienced and junior database administrators.

What is SQLdm Mobile?

SQL diagnostic manager (SQL dm) Mobile is a Web application that displays real-time SQL Server performance dashboards on a variety of mobile devices, including iPhone, iPad, Android and Blackberry. SQLdm Mobile includes the Idera Newsfeed technology. The Idera Newsfeed is a revolutionary new way for DBAs and managers to collaborate, share knowledge, and keep close tabs on their most critical SQL Server issues.

How SQLdm helps

Whether you need immediate diagnostic information or want to gather data for long-term capacity planning, you can use SQLdm to help:

- Increase SQL Server availability
- Provide a comprehensive view of current performance
- Provide continuous, unattended monitoring
- Store data in the centralized SQLdm Repository database
- Improve the productivity of both skilled and novice database administrators

With clear, easy-to-understand charts and reports, you can track standard SQL Server performance metrics, trend historical performance data over time, and proactively identify potential performance problems.
Find answers

This documentation set includes a comprehensive online Help system as well as additional resources that support you as you install and use the product. You can also search Idera Solutions, available at the Idera customer support portal.

View help topics

SQLdm Help supports the following Web browser minimum requirements:

- Internet Explorer 8
- Mozilla Firefox 4
- Google Chrome 6

Print help topics

You can print a help topic by selecting the topic in the table of contents, and then clicking the Print this topic icon on the right side of the Help window.

Use the PDF if you want to print more than a single topic. To print, click the PDF tab, and then click the Print file button. In the Print dialog box, select the pages you want to print before clicking Print.

Contact Idera

Please contact us with your questions and comments. We look forward to hearing from you. For support around the world, please contact us or your local partner. For a complete list of our partners, please see the Idera web site.

How to use Help

This Help system can be accessed either through the Help menu or by pressing F1 on your keyboard while on the window you would like more information.

To search for topics that explain the specific information you need, select the Search All Help tab, type in the keyword in the space provided, and click Search for a list of all the topics that contain the keyword you entered.

To print the SQLdm Help topics:

1. Select the top-level node in the table of contents and click the Print button.
2. Check the Print the selected heading and all subtopics box to open your print dialog.
About Idera

At Idera, we deliver a new generation of tools for managing, administering, and securing your Microsoft Windows Servers, including SQL Server, SharePoint, PowerShell and Microsoft Dynamics. We employ numerous industry experts worldwide who are devoted to bringing proven solutions to you, the administrator. Idera provides solutions that help you ensure server performance and availability and reduce administrative overhead and expense. Our award-winning products install in minutes, configure in hours and deploy worldwide in days. Idera is a Microsoft Gold Certified Partner headquartered in Houston, Texas, with offices in London, UK, Melbourne, Australia, and Sao Paulo, Brazil.

Idera products

Our tools are engineered to scale - from managing a single server to enterprise deployments with thousands of servers. Idera products combine ease of use with a design that installs in minutes, configure in hours, and deploy worldwide in days. To learn more about Idera products, visit http://www.idera.com.

---

**New features and fixed issues**

SQLdm 8.5 provides the following new features and fixed issues.

### 8.5 New features

**Full support for SQL Server 2014**

SQLdm 8.5 fully supports monitoring of SQL Server 2014 RTM. Users who implement the SQL Server 2014 In-Memory OLTP Engine functionality should note that SQLdm does not support this feature at the moment.

**Hyper-V support**

SQLdm 8.5 has extended virtual support to Hyper-V, providing users insight into the performance of their virtual system more effectively. Users can track and monitor Hyper-V specific performance metrics for a complete view of the virtualized server and the physical host. For additional information, see How SQLdm works with a virtual environment.

**Tech Preview of the new SQLdm web console**

In SQLdm 8.5 rapidly and easily identify problems. The [SQLdm web console](https://www.idera.com/sqldm/web-console) is designed to provide quick access to the overall status of the SQL Server environment to help diagnose any issues.

- Quickly view status of a single instance or instance groups.
- Access from any connected browser. No SQLdm Desktop Console required.
- Stand-alone web application with no need for IIS.
- Provide an easy to use web console to non-DBAs without giving access to entire management console so they can check on status of their SQL Server environment.

To provide feedback on the Tech Preview of the SQLdm web console, access the [Idera community forum](https://www.idera.com/forum).
The SQLdm REST Service requires a service account that is a *local administrator*. If the service account provided during installation for the SQLdm services is not a local administrator, you need to manually change the service account in Windows Service Control Manager.

**Monitoring and alerting enhancements**

**Enhanced alert response usability**

Ability to set up Alert Response that is triggered only after multiple user defined metric thresholds have been breached. For additional information, see Configure automated responses to alerts.

**Inclusion filters for Query monitors**

Ability to do query monitoring on selected applications, databases, and SQL text. For additional information, see Configure advanced query monitor options.

**New filter in the Signature Mode and Statement Mode views**

Ability to exclude data returned with null values through the **Exclude Currently Running Queries** filter in the Signature Mode and Statement Mode views.

**Improved Maintenance Mode flexibility**

Additional monthly option for scheduling maintenance mode on monitored SQL server instances. For details, see Schedule Maintenance Mode.

**Virtualization counters available for custom reports**

Select both Hyper-V and VMware virtualization counters when creating a custom report. For additional information, see Select counter type and counters.

**Run one-click System Diagnostics**

Ability to run system diagnostics and collect service and desktop client logs in the System Diagnostics window. See System Diagnostics for details.

**Deadlock victim details now available in the Deadlock Sessions Report**

The Deadlock Sessions Report of the **Sessions>Blocking** view includes deadlock victim information by default. Users no longer have to manually add this option through the **Column Chooser** dialog. For additional information see, Analyze blocked sessions.

**Configuration option added to control WMI timeouts**

Configure the WMI timeout value in SQLdm when suitable. For instructions, see Configure OS metrics monitoring.
8.5 Fixed Issues

General

- An issue causing settings in the Monitored SQL Server Properties window to revert no longer occurs.
- This release fixes an issue in deadlock data collection that caused discrepancies in the UTCCollectionDateTime.
- An issue causing SQLdm to display an error on the monitored SQL Server 2014 instance when expanding the databases node, no longer occurs.
- Some users may experience Windows console crashes, applying the Microsoft update 2919355 solves this issue. For additional information on this solution, see the Microsoft knowledge base articles:
  - Out of memory when you load some image resources in a Windows application.
  - Platform update for Windows 7 SP1 and Windows Server 2008 R2 SP1.

Alerts

- An issue preventing cluster failover alerts to be triggered no longer occurs in SQLdm 8.5.
- An issue preventing SQLdm to update statistics for some monitored SQL servers that triggered a persistent alert ‘Unable To Monitor’ no longer occurs in version 8.5.

Reports

- This release fixes an issue impeding the VM Statistics report to display correctly.
- An issue preventing users from exporting the Blocking Sessions report in XML no longer occurs.
- An issue preventing the CPU Statistics report to display correctly when being deployed to the Microsoft Reporting Services no longer occurs.

Previous features and fixed issues

This build includes many fixed issues, including the following updates from previous releases.

8.0.1 New Features

There are no new features for SQLdm 8.0.1.

8.0.1 Fixed Issues

General

- Users with large Repository databases no longer experience high CPU Usage by the sqlserv.exe process.
- An issue causing occasionally negative CPU Delta (ms) and Physical I/O Delta values in the Details view of the SQLdm Sessions tab, when parallel usage of CPU is enabled, no longer occurs.

Management Service Log

- An issue causing exceptions in the SQLdm Management Service logs when removing an availability group or replica from Availability Group Topology no longer occurs.
The exceptions logged for ‘primary and foreign key duplication errors’ no longer occur.

**AlwaysOn Availability Groups**

- An issue causing deadlock errors after updates to the AlwaysOn Availability Group Topology tables in SQLdm no longer occurs.

**Mobile**

- Users who remain logged in the Idera Newsfeed account and upgrade to SQLdm 8.0.1 no longer experience console crashes.

**8.0 New Features**

**SQLdm now fully supports the AlwaysOn Availability Groups feature of SQL Server 2012**

SQLdm 8.0 now allows DBAs to monitor their availability groups, availability replicas, and availability databases. Support for this feature comes with:

- An Availability Group Statistics report that allows you view the historical health of your availability groups, availability replicas, and availability databases.
- An Availability Group Topology report that allows you to view the current topology of your availability groups configuration.
- Monitoring of key metrics specific to the AlwaysOn Availability Groups feature.
- Queue Size and Transfer Rates charts.

For additional information on SQLdm and the AlwaysOn Availability Groups feature, see Monitor AlwaysOn Availability Groups.

**SQLdm now offers integration with Microsoft System Center Operations Manager (SCOM)**

SQLdm 8.0 now includes the SQLdm Management Pack (SQLdm MP) to enhance the SQL Server monitoring capabilities of Microsoft System Center Operations Manager (SCOM). Detailed alert and status information tracked by SQLdm provides SCOM with a wealth of knowledge not previously available including:

- Seamless integration between SQLdm and the SCOM health model and console.
- More robust overview of your server health and performance through the addition of SQLdm metrics to the current SCOM ability to use availability to determine SQL Agent health.
- Detailed record of state changes and events that might impact the availability and performance of your server.
- Instant access to the SQLdm Console from SCOM, providing access to vital insights not readily available using SCOM alone.

For additional information about using SQLdm with System Center Operations Manager, see Integrate SQLdm with SCOM.

**Change Log Summary report**

The Change Log Summary report allows users to view a list of all actions and configuration changes performed in their SQLdm environment over a specified period of time. For additional information on this report, see Change Log Summary.
**Improved collection of query and non-query activities**

SQLdm 8.0 now allows users to collect solely queries’ performance data through the Query Monitor tab in the Monitored SQL Server Properties window. Configure collection of non-query activities such as deadlocks and autogrow events through an independent window, the Activity Monitor tab.

**Blocked Process report available in SQLdm**

SQLdm users are now able to view the captured Blocked Process report directly in their SQLdm console. In the Activity Monitor tab, users can configure the Blocked Process Threshold (in seconds) that results in the Blocking Process and Blocked Process details report. To access this report, users can go to Sessions>Blocking and double click under Block Reports. For more information on this feature, see Set activity monitor options.

**Improved Maintenance Mode and Snooze Alerts features**

In the SQLdm 8.0 version, applying maintenance mode modifications to a large number of servers at once is possible through the Maintenance Mode command. Review Schedule Maintenance Mode for details. Also users that want to tackle several alerts, can mass snooze/resume alert generation through the Snooze Alerts/Resume Alerts commands. For additional information, see Snooze Alerts.

**SQLdm console supports Operating Systems where FIPS compliance is required**

The SQLdm 8.0 console supports operating systems with enabled system cryptography that use FIPS (Federal Information Processing Standard) complaint algorithms. For more information about FIPS compliance, see the Microsoft document, FIPS Compliance.

**SQL Server 2014 experimental support**

SQLdm 8.0 is SQL Server 2014 compatible. This version of SQLdm is not certified against newer builds of SQL Server and should not be used with these builds in a production environment. Idera provides experimental support while you use your installation in a testing environment to ensure the features you rely on most are working as or better than expected.

Users who implement the SQL Server 2014 In-Memory OLTP Engine functionality should note that SQLdm does not support this feature at the moment.

**8.0 Fixed Issues**

**General**

- An arithmetic overflow error that converts expression to data type integer in the Query Waits and Session Details views no longer occurs.
- An issue causing errors related to data retention or data visibility in the History Browser no longer occurs. Note that some views in SQLdm only collect data on demand in the repository after configuration.
- In SQLdm 8.0 users are now able to limit the amount of memory used by the desktop client.
Servers

- This release fixes an issue that occurred while refreshing the Server Summary view.

Databases

- An issue causing errors related to fragmentation collector timeouts or fragmentation statistics collection in the Tables & Indexes view no longer occurs.

Services

- This release fixes an issue caused when the collector for the SQL Agent Jobs View could not interpret null values, resulting in job and job steps collection errors.

Alerts

- The transactions (Per Second) metric now displays correctly in the History Browser when user selects a historical snapshot.
- This release fixes an issue where after modifying the advanced configuration settings of the SQL Server Status alert, the Lowered to OK status still showed.

Resources

- An issue causing an unknown value in the User/Schema column of the Procedure Cache view no longer occurs.

Reports

- An issue preventing users from running the Alert History Report after deployment to Reporting Services no longer occurs.

7.5.4 New Features

General

Charts now properly manage real-time and scheduled collection data in the same time span

SQLdm charts provide data whether collected real time or as part of a scheduled collection event. If you pause or leave this view and then return during the same Console session, SQLdm displays the real-time data points as previously viewed, followed by a period of data points from any scheduled collections that occurred while you were away. For additional information about how SQLdm displays charts, see Charts.

Queries

Query Waits now located on Queries tab

The Query Waits feature is no longer located on the Resources tab but now is available on the Queries tab. For additional information about Query Waits, see View Query Waits.
Alerts

Manage how the SQLdm Console responds to alert notifications
SQLdm can now play a sound when an event triggers an alert to change states. You can also control how SQLdm displays the resulting alert notification in the Console. For additional information about Console notifications for alerts, see Configure notification settings.

Set SQLdm to notify you of only critical alerts
Use the Notifications section of the Console Options feature to set SQLdm to notify you for only critical alerts. You can select whether you want to view or even play a sound when a critical alert occurs. For additional information about Console notifications for alerts, see Configure notification settings.

Mobile

SQLdm Mobile & Idera Newsfeed now supports IIS 8
SQLdm Mobile & Idera Newsfeed now supports IIS 8 on Windows 2012 and Windows 8 environments. For additional information about SQLdm Mobile & Idera Newsfeed requirements, see SQLdm Mobile and Idera Newsfeed Requirements.

7.5.4 Fixed Issues

General

- SQLdm now responds to the collection filtering set for disk drives to prevent the Collection service from gathering data on non-monitored disks.
- Users who upgraded to SQLdm 7.5.3, and who collect data using a direct WMI connection no longer experience an issue causing an instance to stop collecting snapshots.
- An issue causing errors when the Collection service attempted to collect Table Growth information no longer occurs.

Servers

- SQLdm no longer pauses data point creation in other real-time panels when the user accesses the Timeline view.
- This release fixes an issue caused when the scheduled refresh did not successfully complete, resulting in missing History Browser snapshots.
- The SQL Server Plan Cache object no longer continues to grow with SQLdm queries even with the SQL Server Optimize for ad hoc workloads server configuration option selected.
- The SQLdm Powershell plug-in now properly puts monitored SQL Server instances into maintenance mode when selected.

Alerts

- The Autogrow alert no longer displays the same previous and current data file size when viewing alert details in the Alerts view.
- SQLdm no longer dismisses certain alerts when SQLdm generates an Unable to Connect, Unable to Monitor, or Paused alerts. These alerts include SQL Server Agent job alerts, VM Host Server Change, VM Resource Configuration Change, Mirroring Server Role Change, and Cluster Failover alerts.
- SQLdm no longer displays an incorrect percentage in the Database Full (Percent) alert.
SQLdm no longer delays generation of some Oldest Open Transaction alerts until the transaction is significantly older than the alert threshold. The alert now triggers immediately when the transaction crosses the threshold.

An issue preventing some users from monitoring multiple instances and causing job completion error alerts no longer occurs.

### Reports

- The Server Summary report now correctly displays statistics graphs and grids even when the results include no data for that interval.
- The Server Statistics report now consistently applies the UTC offset to both servers when using the report to compare two servers.

### Counters/Custom Counters

- When WMI counters are unavailable due to a stall, SQLdm now continues to collect available counter data until it hits the connection limit and triggers an alert.
- VM custom counters now close the connection to the vCenter Server immediately after use, thereby avoiding a high number of connections to the server at one time.

### 7.5.3 New Features

There are no new features for SQLdm 7.5.3.

### 7.5.3 Fixed Issues

#### General

- Users who upgrade to SQLdm 7.5.2 no longer experience missed alerts.
- Users who upgrade from SQLdm 6.2 to a more recent version of SQLdm no longer experience issues upon subsequent upgrades. SQLdm displayed the message, "Query Monitor upgrade paused," in the log and caused excessive connections to the Repository.
- Users with large databases who upgrade to SQLdm 7.5.2 no longer experience Management Service blockage, causing slow inserts into the Repository.
- SQLdm now successfully installs and no longer stalls on the splash screen while displaying the message, "Connecting to Repository."
- The SQLdm Management Service no longer causes high CPU on the Repository.

### 7.5.2 New Features

There are no new features for SQLdm 7.5.2.

### 7.5.2 Fixed Issues

#### General

- When upgrading to SQLdm 7.5.x and a timeout occurs while upgrading the database statistics, SQLdm now properly re-submits the query and no longer indicates that it is running without restarting the stopped upgrade. This issue caused some
users to not see older database information.

- An issue causing the SQLdm console to take a long time to load or time out after upgrading to 7.5 and display the message, "Unable to connect: Timeout expired attempting to open server connection," no longer occurs.
- Users who upgrade to SQLdm 7.5 no longer experience an issue causing the transaction log file to grow dramatically.
- An issue with the stored procedure $p_GetTagServersAsXML$ not closing or deallocating a cursor no longer occurs as the stored procedure no longer uses a cursor.
- An issue with table statistics collection causing a communication problem between the Management Service and the Collection Service is resolved.
- SQLdm no longer displays an "Arithmetic overflow error" message when refreshing the Server Summary view. This issue was caused by a timestamp containing a value greater than the SQL Server Max Integer value.

**Overview**

- An issue causing SQLdm to display some monitored SQL Server instances more than once in the Servers tree no longer occurs.
- The CPU Dashboard panel no longer displays an occasional red "X" in the Call Rates chart when the panel is resized.

**Sessions**

- SQLdm no longer displays the messages, "Error executing Session List collector: Arithmetic overflow error converting expression to data type int," or "Error processing Session List Collector: Object reference not set to an instance of an object," when some users attempt to access pages in the Sessions view.

**Resources**

- SQLdm no longer displays the error message, "The given key was not present in the dictionary," when a user attempts to view Server Waits.

**Alerts**

- SQLdm custom counters now properly trigger alert responses.
- Deadlock and Autogrow alerts no longer persist after the triggering condition is resolved.

**Reports**

- SQLdm no longer displays the message, "Item with the same key has already been added," when some users attempt to run the Top tables by Growth or Top Tables by Fragmentation report.
- Users can now select the time of day in all SQLdm reports by using the Start Hours and End Hours fields.

**7.5.1 New Features**

There are no new features for SQLdm 7.5.1.
7.5.1 Fixed Issues

General

- An issue causing an exception error and possibly preventing some users from closing the SQLdm desktop client no longer occurs.

Overview

- The Memory, Network, and Virtualization panel chart selections are now properly saved when a user saves a Dashboard layout.
- Timeline users who double-click an alert to access the Alerts pane with the selected alert highlighted now receive the proper selected alert information in the Details pane of that view.

Sessions

- On a case-sensitive server, the Sessions Blocking graph now shows the correct deadlocks in the sessions.

Resources

- The Query Waits graphs right-click menu options View Text and View Query History are now operative.

Logs

- A user interface update fixed an issue causing some Microsoft Windows 7 users to see a cut-off Search window in the Log tab.

Alerts

- SQLdm and the Windows Event Log now both show accurate metrics for the OS Disk Free Space (Size) alert.

Reports

- Users who attempt to schedule email notifications for some reports no longer receive an error message at the end of the wizard.
- Generation of the Top Databases report is improved, preventing the report from suffering a time out because of the long load time.
- Disk Details report users no longer receive an exception message when attempting to run the report with the Drive Name field selection of All Drives.

7.5 New Features

There are no new features for SQLdm 7.5.
7.5 Fixed Issues

General

- The SQLdm installer no longer checks your Windows firewall service. If you have communication issues after installation, verify that ports 5166 and 5167 are open for access in Windows firewall and/or whichever firewall you use.
- SQLdm now properly aggregates data based on the number of days displayed in the Aggregate query data into daily records after X days field in the Grooming Options.
- Users monitoring disk activity on Windows 2008 and later operating systems no longer have to wait one second per disk for statistics gathering.
- Users no longer receive "Unable to connect" alerts for monitored SQL Server instances known to be online. The server availability check now attempts one connection retry in order to avoid alerting in case of transient network issues.
- SQLdm now can send email notifications to Gmail accounts and other email accounts using SSL encryption.
- The About Idera SQL diagnostic manager dialog box no longer includes the System Info button.

Virtual Machines

- An issue in the SQL dm Management Service causing some VM statistics to not display for monitored virtual SQL Server instances no longer occurs.

Dashboard

- An issue causing the CPU Dashboard panel to display 0 when a greater value should appear no longer occurs. This issue was caused by SQLdm switching from one counter to another at certain refresh rates when calculating CPU values.

Server Overview

- SQLdm no longer attempts to delete a monitored SQL Server instance in some situations when the user pressed the Delete key while in the Server view.
- An issue causing some users to receive an exception error when attempting to view Server Details after quickly clicking through different panes of the SQLdm Management Console no longer occurs.

Sessions

- The Y-axis unit of time measurement now appears in the Sessions > Locks Wait Time chart as "ms" (milliseconds).

Resources

- Resources > Query Waits times are now in chronological order.
- Users no longer receive the error message, "The given key was not present in the dictionary," when attempting to view the Resources > Server Waits view.
Databases

- SQLdm no longer displays restore activity on the original database instead of the destination database. Now the destination database includes any restore information.

Services

- The SQL Agent Jobs list now retains the open (+) and closed (-) settings after a refresh. This list also remains on the same row after a refresh and no longer jumps to the top of the list.
- An issue causing the job collector to fail for some users no longer occurs. This issue occurred when the user attempted to filter jobs or job categories with a string that included a single quote character (’) in the title.

Alerts

- The Alerts pane now retains your column sort selection when you return to the pane after visiting another page, as when investigating an individual alert.
- SQLdm now sends an alert when a cluster failover occurs even when the server appears as offline in the preceding refresh of the SQLdm Collection Service. Previously, this situation would not trigger a cluster failover alert.
- The Session Tempdb Space Usage (MB) alert now triggers based on the Total User Space Used and no longer includes the Total Internal Space Used in the calculation. This update fixes an issue where users received an alert that shows a tempdb session using more space than the entire size of tempdb.
- The Cluster Failover alert no longer displays a timestamp of 1-1-1900 when an event triggers an alert.
- The Unsubscribed Transactions alert now displays the resulting time in hours, minutes, and seconds for easier comprehension.
- This release fixes an issue that caused some users to receive alerts stating that the data files are over 1000.00% full.
- Users no longer receive multiple email messages for the same alert.

Reports

- Users no longer receive the error message, "An error occurred while retrieving data for this report. Additional information: Invalid Column name. (Microsoft SQL Server, Error: 207)," when attempting to run a custom report.
- An issue causing the Top Queries report to appear empty when the user selected a Custom Range older than seven days no longer occurs.

Custom Counters

- An issue causing some users to receive an error message when attempting to modify an existing custom counter no longer occurs.

7.2.2 New Features

There are no new features for SQLdm 7.2.2.
7.2.2 Fixed Issues

- SQLdm 7.2.2 now displays an accurate Physical I/O metric on the Blocking view of the Session tab.
- SQLdm 7.2.2 no longer displays XML document related error messages to users who upgrade to SQLdm 7.2 with a SQL 2005 repository. To learn more about the cause of this issue, see Microsoft Support Article 968914, "FIX: When you convert a TEXT column to a VARCHAR(MAX) column, an NTEXT column to a NVARCHAR(MAX) column, or an IMAGE column to a VARBINARY(MAX) column, the original NULL values in these columns may become empty strings in SQL Server 2005."
- An issue causing some users to receive an error message when attempting to view details for a monitored SQL Server instance no longer occurs. When this issue occurred, the results were replaced by a large red X.
- Both the Alerts and Custom Area views in SQLdm Mobile now display your custom counters regardless of whether you defined unique category names. By default, SQLdm assigns the category "Custom" to all custom counters.

7.2.1 New Features

SQL Server 2012 RTM Support

SQLdm 7.2.1 supports the use of SQL Server 2012 RTM version. Users who implement the SQL Server 2012 AlwaysOn functionality should note that while SQLdm seamlessly monitors servers with this feature enabled, it does not currently administer or diagnose issues with AlwaysOn.

7.2.1 Fixed Issues

- Users who have implemented SQLdm 7.2 with SQL Server 2012 RC0 in a non-production environment may experience issues with data display on the Tempdb Summary and Database Files views after upgrading to SQLdm 7.2.1. Upgrading to SQL Server 2012 RTM their test environment will remedy this issue.
- SQLdm 7.2.1 no longer displays error messages related to an "XML document" when users who upgraded to SQLdm 7.2 attempt to access the SQLdm Management Console.
- Users who implemented SQLdm 7.2 with SQL Server 2012 RC0 in a non-production environment now receive an accurate name and version number for SQL Server 2012 RTM when viewing the Compatibility Level for a monitored SQL Server 2012 RTM instance.

7.2 New Features

Monitoring SQL Server virtual environments

Get complete insight into the performance of your virtualized SQL Server databases. Monitor and track VMware-specific performance counters allowing you to get a complete performance picture of the SQL Server environment. Two VM-related reports provide performance trends and a summary of your virtualized environment. For additional information about configuring the new VM functionality, see Configure your virtual machine connections.

SQL Server 2012 experimental support

SQLdm 7.2 is SQL Server 2012 RC0 compatible. This version of SQLdm is not certified against newer builds of SQL Server and should not be used with these builds in a production environment. Idera provides experimental support while you use your installation in a testing environment to ensure the features you rely on most are working as or better than expected.

Users who implement the SQL Server 2012 AlwaysOn functionality should note that while SQLdm seamlessly monitors servers with this feature enabled, it does not currently administer or diagnose issues with AlwaysOn. For additional information about SQLdm and SQL Server 2012, see SQLdm Requirements.
SQLdm Mobile views

SQLdm Mobile features a new server dashboard specifically for tablets and incorporated VMWare monitoring data. For additional information about the new SQLdm Mobile features, see SQLdm Mobile Help.

Reporting on Tempdb Statistics

You can now run the Tempdb Statistics report to quickly identify and keep tabs on tempdb performance-related issues. For additional information about the new tempdb report, see Tempdb Statistics report.

SQL Server Memory Usage Percent counter available for custom reports

You can now select the SQL Server Memory Usage Percent counter when creating a custom report. For additional information about creating a custom report, see Custom reports.

Updated alert notification functionality

SQLdm now allows you to suppress system tray notifications when a monitored SQL Server instance returns to an OK status. Click Tools > Console Options. On the Notifications tab, check the Never show console alert notifications when the server status goes to OK checkbox, and then click OK. For additional information about the Management Console options, see Configure Console Options.

CPU Statistics report now available in a custom range of hours

The CPU Statistics report now includes an option for you to select a custom date range and view results in hours. To select this range, click Reports > CPU Statistics. Select the appropriate monitored SQL Server instance, and then select Custom Range from the Period drop-down list. Use the calendar tool to select the range, and then click OK. Select Hours from the Sample drop-down list to view your results in hours. For additional information about the CPU Statistics report, see CPU Statistics report.

Input how long SQLdm waits before raising an alert for a long-running job

Users can now specify a minimum job length for the SQL Server Agent Long Running Job (Percent) alert. This may be used to prevent alerting on short or trivial jobs. For additional information about configuring job exclusions, see Configure Job Exclusions.

7.2 Fixed Issues

- Users with a large number of databases no longer notice a performance issue caused by leaving the SQLdm Dashboard open for a long period of time.
- The Value Configuration window in SQLdm no longer displays blank column headings but includes alert state icons to easily identify the content. You can access the Value Configuration window by clicking Edit on the Alert Configuration window.
- The Login Time column of the Sessions Details page now uses the local time on the client server for the timestamp. You can access the Sessions Details page by clicking Sessions > Details while viewing a monitored SQL Server instance.
- SQLdm no longer displays an error message when a user attempts to view tempdb detail for a SQL Server 2000 monitored instance. Tempdb monitoring is supported for SQL Server 2005 and above monitored instances only.
- Table growth collection no longer fails for monitored SQL Server 2000 servers, allowing the Top Table Growth report to function correctly.
- SQLdm no longer displays an error message when a user attempts to use PowerShell cmdlets to configure Query Monitor.
- The CLR Enabled alert now properly functions after triggering an Informational alert.
- The Export to Excel function on the Tempdb Sessions view no longer fails for users who had cells in the Last Command column containing more than 32,767 characters.
- The Database Statistics report results format is updated and no longer causes any issues in viewing accurate results for users with large databases.
- SQLdm no longer displays and error message when a user attempts to schedule an email delivery of the Top Tables by Fragmentation report.
- The Repository now properly saves Query Monitor data while the grooming job runs.
- A failure in the SQLdm replication monitoring no longer prevents otherwise successful scheduled refreshes from saving to the repository.
- The Table Fragmentation (Percent) alert now changes to gray shading if the alert is raised for more than 12 hours.
- Extremely long queries no longer cause the Query Monitor to generate OutOfMemory exceptions on the Collection Service. These exceptions could previously cause a service crash.
- Users no longer experience an error during installation that caused an error when attempting to validate the user account used to perform the install.
- Performance updates including query aggregation and grooming changes improve SQLdm data collection and processing efficiency.
- SQL Server authentication no longer occasionally fails for users attempting to use a password containing the quotation mark ("), special character.
- When you delete a database, the system is groomed to removes all references to that database. Now the feature also grooms the deleted database from the [SQLServerDatabaseNames] table.

### 7.1.1 New Features

There are no new features for SQLdm 7.1.1.

### 7.1.1 Fixed Issues

- Improvements now allow SQLdm to return data for the Session Details page more quickly and avoid a timeout due to slow or no response.

### 7.1 New Features

**New SQL Server dashboard**

SQLdm now features a completely redesigned dashboard, which dramatically expands the display of your performance data and simplifies the view of the overall health of a SQL Server instance. For additional information about the new dashboard, see the SQL Server performance overview.

**New Tempdb monitoring**

You can now quickly identify and resolve tempdb performance-related issues with the new tempdb monitoring and diagnostic views. For additional information about the new tempdb monitoring functionality, see tempdb status summary.

**New SQLdm Mobile views**

The following new views in SQLdm Mobile make diagnosing performance issues even easier while you're on the go:

- Blocking Chain View
- Sessions > Top Wait Customer View
- Tempdb Monitoring View

For additional information about SQLdm Mobile, see SQLdm Mobile Help.
View and copy SQL Agent Job messages from the Job History list

SQLdm now allows users to view SQL Agent Job messages from the Job History list. Right-click the appropriate job, and then select View Message. A copy feature allows you to copy the existing message and then paste it into a different application. For more information about SQL Agent jobs, see how to Monitor SQL Agent Jobs.

7.1 Fixed Issues

- SQLdm Repository timeouts no longer cause the SQLdm services to stop for some users.
- This release of SQLdm fixes an issue that caused SQLdm to display an error message when some users attempted to configure alerts.
- SQLdm performance improvements decrease the amount of time spent waiting for page loading and processes to complete.
- The CLR Enabled alert now properly retains settings when the user changes the alert state to Informational.
- SQLdm no longer experiences an issue when a user adds servers to a custom view.
- Improved collection functionality corrects an issue causing some users to see an incorrect SQL CPU Usage statistic.
- Refreshing the SQL Agent Jobs view no longer deselects all selected rows.
- The SQLdm Service Availability chart on the Services tab no longer incorrectly displays, "Unable to monitor" when the server is available.
- SQLdm no longer displays an error message when users who upgrade to SQLdm 7.0 attempt to edit their custom counters.
- SQLdm no longer displays the error message, "An INSERT EXEC statement cannot be nested," for some users who attempt to run a report when SQLdm Application Security is enabled.
- SQLdm users monitoring SQL Server instances by IP address instead of name no longer receive the error message, “The server you are trying to access is not monitored by Idera SQL diagnostic manager,” when attempting to view history for a mirrored database.
- Users who have clustered servers no longer receive the error message, "Error interpreting Services Collector: Invalid length parameter passed to the substring function" when attempting to use the Show Real Time View function.

7.0 New Features

New SQLdm Mobile interface

SQLdm now offers a Web application (SQLdm Mobile) that displays real-time SQL Server performance dashboards on a variety of mobile devices, including iPhone, iPad, Android and Blackberry. SQLdm Mobile includes the Idera Newsfeed technology. The Idera Newsfeed is a revolutionary new way for DBAs and managers to collaborate, share knowledge, and keep close tabs on their most critical SQL Server issues.

New Alert Templates

SQLdm now offers alert templates, which allow a user to configure generic alert settings to apply to monitored SQL Servers or groups of servers all at once. You can create and assign alert templates to any of your monitored SQL server instances.

New Informational Alerts

Informational alerts allow you to set a threshold that triggers a status that does not affect the overall status of the server within SQLdm. You can use informational alerts to notify an administrator of the state of a particular metric for a server or trigger secondary processes that could take action to prevent issue escalation.

Improved Alert Response Usability

Alert Response rules, which configure how SQLdm responds when an event triggers an alert, are easier to create and manage due to an updated interface and process. Users can now apply an alert response rule to all metrics quickly and easily.
Improved Notification Times for Unresponsive SQL Server Instances

SQLdm can now alert you more quickly when one of your monitored SQL Server instances becomes unresponsive for any reason. Although the default is set to 30 seconds, you can adjust the interval at which the Collection Service checks whether your SQL Server instances are “up” or available. If a connection is not confirmed within the specified time, SQLdm creates an Unable to Connect alert.

Improved Metrics Collection

The Collection Service now:

- Uses a different SQL Server metric to determine the CPU Busy Value for instances running SQL Server 2005 or later. This change prevents timeout errors during the metric collection process.
- Uses separate processes to collect table growth and fragmentation metrics. This approach ensures quiet time data collection does not delay alerts about other metric thresholds.
- Is able to efficiently collect error log metrics for SQL logs that are large or infrequently cycled.

Improved Repository Performance

The SQLdm Repository database will perform more efficiently due to the following enhancements:

- The Repository grooming job now:
  - Calls the index maintenance in a separate step. Using SQL Server Management Studio, you can now disable this step and then later run your own index maintenance script after the grooming job completes.
  - Better handles I/O and CPU demands when processing data.
- Several stored procedures used by SQLdm Repository were updated.

New Reports

SQLdm now offers the following new reports:

- The Metric Thresholds report is for users who want to view a list of metric thresholds for a monitored SQL Server instance. The report includes the metric name, description, and threshold for their informational, warning, and critical alerts.
- The Disk Details report lists key disk metrics for a specific SQL Server instance. This report offers Disk Time Per Read, Disk time Per Transfer, Disk Time Per Write, Disk Reads Per Second, Disk Transfers Per Second, and Disk Writes Per Second.

7.0 Fixed Issues

Alerting Updates

SQLdm now offers the following updates to alerting:

- SQLdm now accesses the correct database when a user double-clicks an associated Fragmentation alert on the Active Alerts tab of the SQLdm Today page. When you use this feature, SQLdm displays the affected database information on the Tables & Indexes pane of the Databases tab.
- Editing an alert response no longer causes SQLdm to display an error message when attempting to save your changes. This issue affected users who manually changed XML detail in the repository, and then attempted to save additional alert response changes using the SQLdm Console.
- SQLdm now properly captures customer error detail when Error: 0, Severity: 19, State: 0 occurs. This issue affected users using the SQL Server error log alert.
The SQLdm scheduled alert refresh is no longer dependent on table statistics before completing a full refresh and possibly triggering alerts. Because table growth and fragmentation can be long-running processes, SQLdm was delayed in delivering alerts. These items were removed from the scheduled alert refresh for a more responsive alert system.

SQLdm now raises an alert when a monitored SQL Server instance does not respond within the default 30 seconds. You can configure the response time in the Server Properties.

SQLdm now checks to make sure that the WMI services are running before trying to connect to a monitored SQL Server instance. If SQLdm detects that previous attempts to connect are causing multiple connections, it will stop monitoring that server and triggers an alert. All real time views in SQLdm will display an error message explaining the issue. SQLdm automatically resumes monitoring once the number of connections drops below the default of 30 connections.

### Fragmentation Monitoring Updates

SQLdm now offers the following updates to your table fragmentation monitoring:

- SQLdm now accurately collects table fragmentation data on tables within the entered size range. An issue causing SQLdm to collect table fragmentation data on tables less than the entered minimum size no longer occurs.
- Large tables no longer cause a block when collecting table fragmentation on a monitored SQL Server instance. This issue occurred when multiple very large tables were involved. Fragmentation data for populating the reorganization panel on all tables in a database is not collected. The reorganization query in SQLdm 6.1 and SQLdm 6.2 can timeout before table statistics are collected. For more information, refer to Idera Solution 1583.

### SQL Server Statistics Updates

SQLdm now offers the following updates to the functionality that collects and analyzes your SQL Server statistics:

- The Sessions view now retains any custom filtering when viewing your Historical Snapshots. Custom filtering across all snapshots helps you quickly determine changes needing your attention.
- The History Browser on the Queries tab now allows you to scroll when you have large amounts of data.
- The SQL Server Physical I/O chart on the Resources tab now displays values in seconds instead of raw values. Displaying results in seconds provides you with more accurate real-time analysis.
- Users with mirrored databases no longer receive an error message that the mirror is not monitored when the database is actually monitored. This issue affected users viewing their monitored mirrored database information in the real time view on the Mirroring pane of the Databases tab.
- SQLdm now includes a new counter for collecting CPU stats. This new counter include a number of improvements over the previous counter, which occasionally suffered an error due to reaching maximum capacity cumulative CPU time.
- SQLdm no longer displays an error message when a user stops the Session Detail Trace and then refreshes the view. Previously, users received the error message, "Error starting Session Details collector System.InvalidOperationException: BeginExecuteReader: CommandText property has not been initialized."
- Users with very large numbers of tables no longer cause the CPU to reach maximum threshold during table statistics collection. New processes allow SQLdm to read large data sets in smaller chunks to avoid collecting unnecessary data and causing a strain on CPU resources.
- Users working on diagnostics while troubleshooting can now add a configuration file entry to limit the procedure cache row count. The new key is maxRowCountProcedureCache, which has a default value of 10000.
- This release includes improvements to the repository grooming process, which fixes grooming of the ServerActivity table and resolves an issue causing occasional deadlocks during grooming.
Alerting

General

Known issues

Idera strives to ensure our products provide quality solutions for your SQL Server needs. If you need further assistance with any issue, please contact Support. The following issues are known in this version of SQLdm:

Known issues in version 8.5

General

The Query Monitor trace in SQL diagnostic manager does not return queries in progress.

Users with SQL diagnostic manager version 8.0 and later may find that when using the Query Monitor functionality, the queries returned and displayed do not include queries in progress.

SQL diagnostic manager fails to update fields in the VM Configuration window after the virtualization host server is edited.

Users with SQL diagnostic manager version 8.5 may find that fields such as the Virtual Machine name, Type, and Computer Name in the VM Configuration window are not updated correctly after the virtualization host server is changed.

Alerting

SQLdm returns Blocking Session Wait Time alerts with session 0 and missing information when blocking-process node is empty

Some users may experience Blocking Session Wait Time alerts with missing information and session 0 when the blocking-process node is empty in SQL Server. In SQLdm 8.0.1 and later versions, this issue may occur only if the trace that is collecting blocking data doesn’t return a SPID for a blocking process.

SQL diagnostic manager fails to display one alert response when multiple metric thresholds are breached.

SQL diagnostic manager version 8.5 is designed to trigger an alert response only after multiple metric thresholds are breached when the **Where all metrics are in specified list** condition is selected. However, an issue in the “Send a Network Management (SNMP) Trap Message”, “Send an email to recipient”, and “Run the following SQL Script” actions of the Alert Response Window cause these actions to execute several times, resulting in multiple alerts.
The action “Run the following program” fails to execute when configuring automated responses to alerts.

Users with SQL diagnostic manager version 8.0 and later may find that when creating an alert response with the associated action “Run the following program” in the Alert Response window, the specified program does not run once the condition is met.

The actions “Write an event to the Windows event log” and “Send an email to recipient” in the Alert Response Window fail to deliver multiple alert statuses.

Users with SQL diagnostic manager version 8.5 may find that when creating an alert response with multiple metrics as a condition and associated actions “Write an event to the Windows event log” and/or “Send an email to recipient” in the Alert Response window, the feature fails to deliver complete alert information and displays only one alert status when condition is met.

SQL diagnostic manager returns PoweredOff alerts for the VM Power State metric when servers are not turned off.

Some SQLdm 8.5 users may view PoweredOff alerts when reviewing the generated “VM Power State” alerts for their servers linked to vCenter or Hyper-V host servers. These alerts display even though the servers are not turned off.

**Known issues in version 8.0**

### Installation and configuration considerations

The SQLdm Setup Wizard is interrupted after selecting the SQL server instance on which you want to install the SQLdm Repository

Some users may experience an interruption due to memory corruption in their SQLdm installation after selecting the SQL Server instance on which they want to install their SQLdm Repository. Note that the SQLdm installer does not complete on machines where memory corruption prevents connections to SQL Server. Furthermore, in these types of environments other applications such as SQL Server Management Studio also do not function.

**Negative values received from vCenter as a warning message do not impact VM data collection**

Some users may receive negative values from vCenter as a warning message. The message is logged as in the SQLdm Services. Note that this does not have any impact in terms of VM data collection and users are able to view VM and VM Host data.

**Console crashes when upgrading to SQLdm 8.0 while logged in the Idera Newsfeed account**

Users who remain logged in the Idera Newsfeed account and upgrade to SQLdm 8.0 may experience console crashes. Note that an upgrade from SQLdm 8.0 to 8.0.1 will solve this issue.

**Previous Known Issues**

**General**

**SQLdm 7.5 no longer supports Microsoft Windows 2000 or the .Net 2.0 framework**

SQLdm 7.5 does not support Windows 2000 or the .Net 2.0 framework. While SQLdm 7.2 and prior versions continue to operate with Windows 2000, SQLdm 7.5 and later require the .Net 4.0 Full framework to take advantage of the additional features. For additional information about supported versions, see SQLdm requirements.
Server Overview

Timeline refresh causes a memory leak
SQLdm experiences a memory leak when you are viewing the Timeline and click Refresh. To free the memory, you must restart the SQLdm Management Console.

Queries

Queries view filter may not properly filter in some situations
In environments with large databases, the Queries view filter may not properly filter if you attempt to change filter properties during a refresh.

Resources

File Activity displays an unhelpful error message when WMI credentials are invalid
SQLdm displays the error message, "An error occurred while refreshing the active view," when you attempt with access the Resources > File Activity view if your WMI credentials are invalid. If this message appears, verify your WMI access credentials and try again.

Installation and configuration considerations

SQLdm Repository computer must run Microsoft SQL Server 2005 or later
SQLdm 7.0 and later require Microsoft SQL Server 2005 or later running on the computer that hosts the SQLdm Repository database for all installations.

SQLdm Console only users cannot upgrade to the full version without uninstalling SQLdm
Users who have an installation of SQLdm Console only on a computer can use the upgrade to update their current version of the desktop client console, but cannot use the upgrade program to install the full version of SQLdm.

Registering a SQL Server instance that uses an Alias Name requires an alias on the host computer
When registering a SQL Server instance using the alias name, an alias must first be created on the computer that hosts the SQLdm Management and Collection Services. If the instance uses Named Pipes, Named Pipes must be enabled in the SQL Server network configuration of the aliased SQL Server instance.

Management Service does not start when the account permissions are incorrect
If the account you specified for the SQLdm services does not have System Administrator privileges on the SQL Server instance hosting the Repository database, the setup program cannot start the SQLdm Management Service. This issue only occurs during installation.

Some users may receive an error message when opening the SQLdm stating that there is no valid license available
To resolve this issue, use the Management Service Configuration wizard to specify credentials for a Windows account or SQL Server login that has System Administrator privileges on the SQL Server instance hosting the Repository database. You can start the Management Service Configuration wizard from the Programs menu.

SQLdm Reporting does not support Microsoft Reporting Services 2000
SQLdm only supports Microsoft Reporting Services 2005 and later.
**SQLdm requires Predictive Analytics for baseline-related results**

SQLdm 7.5 requires the Predictive Analytics Service in order to display baseline-related results. During installations and upgrades, SQLdm installs the Predictive Analytic service with the other included services. If Predictive Analytics is not detected or is disabled, SQLdm cannot generate baseline data for the requested report. The following reports require the Predictive Analysis Service to include baseline-related results:

- Baseline Statistics
- CPU Statistics
- Memory Statistics
- Sessions Statistics
- Disk Statistics
- Replication Statistics

**Phase out SQLdm mobile manager**

Idera is announcing end of life for SQL mobile manager (SQLmm). On October 1, 2012, all support for SQLmm will stop and the SQLmm trial site will be decommissioned. Also, any remaining installations of SQLmm 3.6 or earlier that use the Idera redirectors will no longer work.

To continue using a Web-based monitoring solution that is accessible from your smart phones or tablet devices, upgrade to SQLdm 7.0 or later, and deploy SQLdm Mobile.

Idera discontinued distribution of SQL mobile manager in October 2011.

**SQLdm Mobile does not support Microsoft IIS Express**

SQLdm Mobile requires the standard version of the Microsoft IIS Web Server, version 7.0 or later. For more information, see the SQLdm Mobile requirements.

**SQLdm Mobile & Newsfeed installation cannot be changed or repaired using Add/Remove Programs**

To successfully change or repair your SQLdm Mobile & Newsfeed installation, uninstall the application and components, and then run the setup program to reinstall your deployment.

**SQLdm may not properly link to vCenter from some monitored virtual SQL Server instances**

The SQLdm VM Configuration window displays a list of your monitored virtual SQL Server instances, but the link between an instance and the associated vCenter may not work properly. To access this window, click Tools > VM Configuration.

**VM Host Server Change alert not always triggered when a VM moves from one host server to another**

Even if the circumstances warrant SQLdm to trigger the VM Host Server Change alert, users who have virtual machines running on an ESX host managed by vCenter 5.0 or later may not receive the alert when they move a VM from one host to another.

**Negative values received from vCenter as a warning message do not impact VM data collection**

Some users may receive negative values from vCenter as a warning message. The message is logged as in the SQLdm Services. Note that this does not have any impact in terms of VM data collection and users are able to view VM and VM Host data.

**Query Monitor disregards filter for SQL Server 2000 users**

Some SQL Server 2000 users may notice that SQLdm Query Monitor includes SQL diagnostic manager queries in the results even if the Exclude SQL diagnostic manager queries checkbox is checked in the Advanced Query Monitor Configuration window.
**SQLdm Mobile Server Dashboard charts display “Data not available” error**

This error indicates that SQLdm Mobile was not able to collect all the performance metrics tracked by these charts. This issue is more likely to occur with the I/O and Per Read/Write charts on the Disk dashboard. To correct this issue, use the Microsoft IIS Manager console to restart the SQLdm Mobile Web site (virtual directory).

**Start and Stop service actions not supported for virtual SQL Server instances**

The Start and Stop service actions are not supported for virtual SQL Server instances (instances located on a Windows cluster node). To start or stop a service on a virtual SQL Server 2008 instance, use the Microsoft Failover Cluster Management tool. For SQL Server 2005 or earlier, use the Microsoft Cluster Administrator tool to manage services.

**Gaps between the real-time view and back-filled historical data can be seen on the CPU view**

This occurs only when the CPU view is accessed via the Server tree. To view the information, without any gaps, access the CPU view via the ribbon.

**Free disk space reported as zero on databases with special characters**

For servers and path names that include special characters such as % or #, SQLdm may incorrectly report the remaining disk space as zero.

**Recommended Idera solutions**

Idera strives to ensure our products provide quality solutions for your database needs. The following Idera Solutions have been recently added to the knowledge base at the Customer Service Portal.

<table>
