Schedule Auto-Discovery of New Servers	●		
Setup and Receive Email Alerts for Health Checks	●		

DBA teams often have plenty of work on their plate and want to find ways to easily maintain and update their SQL Server database environment. They need to quickly identify the location of all SQL Servers in the environment, both physical and virtual, and be notified which ones are behind on patch level, need to be backed up, or are currently down and need attention.

DBAs and their managers often need to view the internal inventory by size to manage SQL Server capacity levels for chargebacks to business groups. They also need a way to track server growth for future capacity needs and reallocation of server resources for different applications or user groups.

DBA and IT Managers want peace of mind that their team can find any databases or servers that aren't up to the latest specs and avoid any risk of data breaches due to back-level patches. They are on the hook to generate reports demonstrating that the SQL Server environment is up to date and current on licensing to avoid any unnecessary or excessive costs.

DISCOVER WHY IDERA IS THE BEST SQL INVENTORY TOOL

Comprehensive yet simple discovery and tracking of your SQL Server environment is essential as your organization grows.

SQL Inventory Manager provides unrivaled tools to help you keep track of and manage your database environment from one web-based dashboard without having to be an expert in Microsoft SQL Server.

Basic SQL Server discovery capabilities are provided by some solutions, but with IDERA you get much more. SQL Inventory Manager provides a broad enterprise-wide view of all your SQL Servers through automated discovery as well as simple, actionable information about the state of your environment.

Unlike Quest Discovery Wizard, IDERA SQL Inventory Manager is able to discover database instances on AlwaysOn Availability Groups and SQL Server BI services as well as create tags at the server, instance and database levels to organize by owner, location, function or other categories to suit different needs.

Perform health checks on monitored servers and get a simple list with recommendations for improvement from SQL Server experts. Plus, receive automatic alerts for key server indicators such as server unavailable or server running out of space. Microsoft Assessment & Planning toolkit does not provide this level of vital information.

Download a free, full-function 14-day trial of IDERA SQL Inventory Manager.

Discover for yourself how it can make your life simpler, save your company time and money, and help make you a rock star DBA in your organization.
